## Hopcroft-Karp Algorithm

The Hopcroft-Karp algorithm is a graph algorithm that finds the maximum cardinality matching in a bipartite graph.

## Bipartite Graph

A graph is bipartite if its vertices can be divided into two disjoint sets such that every edge connects a vertex in one set to a vertex in the other set.

# Definitions

## Bipartite Graph

A graph is bipartite if its vertices can be divided into two disjoint sets such that every edge connects a vertex in one set to a vertex in the other set.

## Maximum Cardinality

A matching in a graph is a set of edges such that no two edges share a common vertex. Maximum cardinality means maximum possible matching.

# Definitions

## Bipartite Graph

A graph is bipartite if its vertices can be divided into two disjoint sets such that every edge connects a vertex in one set to a vertex in the other set.

## Maximum Cardinality

A matching in a graph is a set of edges such that no two edges share a common vertex. Maximum cardinality means maximum possible matching.

## Free vertex

A free vertex is a vertex with no matching edge connected to it.

  - 5: **end while**
  - 6: Output the matching  $M$  as the maximum cardinality matching.
-

# Example

A bipartite graph is given below where we will find its maximum cardinality matching:

# First iteration: BFS

$$F = \{\}$$

# First iteration: BFS

$$F = \{e, f, h\}$$

# First iteration: BFS

$$F = \{e, f, h\}$$

# First iteration: BFS

$$F = \{e, f, h\}$$

# First iteration: BFS

$$F = \{e, f, h, \textcolor{red}{g}\}$$

# First iteration:DFS

$$F = \{e, f, h, g\}$$

$$P = \{(e - a)\}$$

# First iteration:DFS

$$F = \{e, f, h, g\}$$

$$P = \{(e - a)\}$$

# First iteration:DFS

$$F = \{f, h, g\}$$

$$P = \{(e - a)\}$$

# First iteration:DFS

$$F = \{\textcolor{red}{f}, h, g\}$$

$$P = \{(e - a), (\textcolor{red}{f} - \textcolor{red}{c})\}$$

# First iteration:DFS

$$F = \{h, g\}$$

$$P = \{(e - a), (f - c)\}$$

# First iteration:DFS

$$F = \{h, \textcolor{red}{g}\}$$

$$P = \{(e - a), (f - c), (\textcolor{red}{g} - d)\}$$

# First iteration:DFS

$$F = \{h\}$$

$$P = \{(e - a), (f - c), (g - d)\}$$

## After first iteration

After running the DFS on the remaining part,

$$M = \{(e - a), (f - c), (g - d)\}$$

## Second iteration: BFS

$$F = \{ \}$$

Augmenting path =  $b \rightarrow e$

## Second iteration: BFS

$$F = \{\}$$

Augmenting path =  $b \rightarrow e \rightarrow a$

## Second iteration: BFS

$$F = \{H\}$$

Augmenting path =  $b \rightarrow e \rightarrow a \rightarrow h$

## Second iteration:DFS

$$F = \{H\}$$

$$P = \{\}$$

$$M = \{(e - a), (f - c), (g - d)\}$$

## Second iteration:DFS

$$F = \{H\}$$

$$P = \{(h - a)\}$$

$$M = \{(e - a), (f - c), (g - d)\}$$

## Second iteration:DFS

$$F = \{H\}$$

$$P = \{(h - a)\}$$

$$M = \{(e - a), (f - c), (g - d)\}$$

## Second iteration:DFS

$$F = \{\}$$

$$P = \{(h - a), (a - e)\}$$

$$M = \{(e - a), (f - c), (g - d)\}$$

## Second iteration:DFS

$$F = \{\}$$

$$P = \{(h - a), (e - b)\}$$

$$M = \{(f - c), (g - d)\}$$

## Second iteration:DFS

$$F = \{\}$$

$$P = \{(h - a), (e - b)\}$$

$$M = \{(f - c), (g - d)\}$$

## Second iteration:DFS

$$F = \{\}$$

$$P = \{(h - a), (e - b)\}$$

$$M = \{(f - c), (g - d)\}$$

# Algorithm termination

As no more free vertex is available, the algorithm terminates and finally we get the following graph with maximum cardinality 4 where

$$M = \{(h - a), (e - b), (f - c), (g - d)\}$$

- 5 Applications

# Time Complexity

- The time complexity of the algorithm is  $O(E * \sqrt{V})$ , where  $E$  is the number of edges and  $V$  is the number of vertices in the graph. This means that the time required to run the algorithm increases linearly with the number of edges, but is also influenced by the square root of the number of vertices.

# Time Complexity

- The time complexity of the algorithm is  $O(E * \sqrt{V})$ , where  $E$  is the number of edges and  $V$  is the number of vertices in the graph. This means that the time required to run the algorithm increases linearly with the number of edges, but is also influenced by the square root of the number of vertices.
- The time complexity of the algorithm is considered efficient for most bipartite graphs, but may not be the best choice for extremely large graphs.
